

Dashboard Documentation

1. Purpose

The dashboard provides stakeholders with interactive insights into property prices, market trends, and investment opportunities. It consolidates multiple KPIs and visualizations into a single interface for decision-making.

2. Data Sources

- **Property Listings Dataset:** Location, property type, square footage, price, amenities
- **Transaction Records:** Historical sales and rental data
- **Derived Tables:** Calculated measures and aggregated views

3. Data Model

- **Fact Table:** Transactions (price, date, property ID)
- **Dimension Tables:** Property details, location, amenities
- Relationships modeled in Power BI for efficient querying

4. KPIs (DAX Measures)

- **Average Price**
- **Price per Sqft**
- **Growth %**
- **Market Share by Property Type**

5. Dashboard Components

- **KPI Cards:** Display average price, growth %, and market share
- **Clustered Bar Charts:** Compare property types across locations
- **Line Charts:** Show price trends over time
- **Heatmaps:** Highlight demand hotspots in urban vs suburban areas
- **Interactive Filters:** Allow drill-down by location, property type, and amenities

6. Key Insights

- Urban centers show higher volatility compared to suburban markets
- Location and property size are the strongest predictors of price
- Amenities like parking and school proximity significantly influence pricing
- Mid-range properties in emerging suburbs offer stable investment opportunities

7. User Interaction

- **Filters:** Select city, property type, or time period
- **Drill-through:** Click on KPIs to view detailed breakdowns
- **Export Options:** Download charts and tables for reporting

8. Maintenance

- Data refresh scheduled weekly
- DAX measures reviewed quarterly for accuracy
- Dashboard versioning maintained in GitHub repository
